

# Louved Ventilation Systems

Dyer Environmental Controls provide louvre windows solutions for natural and smoke ventilation purposes. Working closely with Fieger, Dyer are able to develop bespoke designs for each project.

These systems are an ideal solution for end of corridor requirements, particularly within high-rise buildings. The advantage they have over traditional windows is the significantly larger ventilation area.

All of our louvre systems are tested in accordance with EN 12101-2 to provide dual-purpose day-to-day natural ventilation and emergency smoke ventilation.

The vents are operated by D+H 24 V DC louvre drives. The drives are wired to the control system to be triggered by a fire alarm or Dyer smoke detector.
